1. FEATURES AND USES

FUJICOLOR SUPERIA 1600 [CU] is a daylight-type ISO 1600 color negative film that incorporates 4th Color Layer and the newly developed Nano-structured Σ (Sigma) Grain Technology to achieve high image quality when printed on FUJICOLOR papers.

- **Excellent Grain Quality**: Highly uniform fine grain, regardless of the film’s ultrahigh speed
- **Ultrahigh Speed**: High suitability for low-light environments, such as indoor home scenes, wedding ceremonies, parties, stage performances, sunset and night scenes, as well as fast action, sports scenes, night-sky photography, and press photography
- **Wide Exposure Latitude**: Remarkable results in bright surroundings such as in outdoor photography under clear skies, providing good image depth and high fidelity even if under-exposed
- **Vibrant, Natural Color Reproduction**: Vibrant and dynamic reds, blues, and yellows
- **Excellent Sharpness**: Extremely sharp depiction of all aspects of the subject, from overall form to textural details
- **Excellent Exposure Suitability even under Fluorescent Lighting**: Accurate color reproduction even under fluorescent lights
- **Excellent Gray Balance**: Precisely maintained gray balance throughout, from the brightest highlights to the deepest shadows

It requires no color-compensating filters when used under daylight conditions or with an electronic flash.

2. SPEED

<table>
<thead>
<tr>
<th>Light Source</th>
<th>Speed</th>
<th>Filter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Daylight</td>
<td>ISO 1600/33°</td>
<td>None</td>
</tr>
<tr>
<td>Tungsten Lamps</td>
<td>ISO 400/27°*</td>
<td>LBB-12** (or Wratten No.80A)</td>
</tr>
</tbody>
</table>

* Indicates the effective speed resulting from designated filter use.
** Fuji Light Balancing Filter

3. EXPOSURE GUIDE

Use an exposure meter for exposure determination. If a meter is not available, refer to the following table.

**Daylight Exposure Guide Table**

<table>
<thead>
<tr>
<th>Light Conditions</th>
<th>Lens Aperture</th>
<th>Shutter Speed (sec.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Seashore or Snow Scenes under Bright Sun</td>
<td>f/22</td>
<td>1/2000</td>
</tr>
<tr>
<td>Bright Sunlight</td>
<td>f/16</td>
<td></td>
</tr>
<tr>
<td>Hazy Sunlight</td>
<td>f/16</td>
<td></td>
</tr>
<tr>
<td>Cloudy Bright</td>
<td>f/11</td>
<td></td>
</tr>
<tr>
<td>Cloudy Day or Open Shade</td>
<td>f/8</td>
<td></td>
</tr>
</tbody>
</table>

**Low Light Exposure Guide Table**

<table>
<thead>
<tr>
<th>Light Conditions</th>
<th>Lens Aperture</th>
<th>Shutter Speed (sec.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fine Weather Daytime Indoor Scenes</td>
<td>f/2.8 to 5.6</td>
<td>1/250</td>
</tr>
<tr>
<td>Nighttime Indoor Scenes (under Fluorescent Light)</td>
<td>1/2.8 to 4</td>
<td>1/60</td>
</tr>
<tr>
<td>Evening Scenes</td>
<td>f/4 to 5.6</td>
<td>1/125</td>
</tr>
<tr>
<td>Night Scenes</td>
<td>f/2.8 to 4</td>
<td>1/60</td>
</tr>
</tbody>
</table>

**NOTES**

- The foregoing settings are for 2 hours after sunrise and 2 hours before sunset.
- Provide lens openings 1/2-stop smaller during the summer and 1/2-stop larger during the winter.
- Excessively bright (or dark) or backlighted subjects may require plus or minus 1-stop lens opening adjustments.

Since light intensities for indoor and night scenes vary widely from location to location, the data above should be used only as a guide.
4. EXPOSURE UNDER VARIOUS LIGHT CONDITIONS

Daylight

Even when exposed under morning or evening twilight conditions or when color temperatures are low, no special filter use is needed as color balancing can be done during printing.

Electronic Flash

• Electronic flash produces light similar to daylight, so filters are not needed. However, the possibility of undesirable effects on color balance, due to various factors (differences in equipment, amount of use, etc.) should be taken into consideration. Test exposures are recommended.

• If shutter speeds slower than 1/125 second are used, light from non-flash sources, such as room lighting, may cause color imbalances. Make test exposures.

• The use of a flash meter is advisable, but the following formula can also be used to obtain satisfactory lens opening.

\[
\text{Aperture} = \frac{\text{Electronic Flash Guide Number (at ISO 1600)}}{\text{Electronic Flash-to-Subject Distance (meters or feet)}}
\]

• Set the film speed at ISO 1600. Since the amount of light reflected onto subjects from surrounding surfaces will differ with the conditions, refer to the flash unit instructions.

Daylight Photoflood/Photo-Reflector Lamps

• Daylight-type photoflood or photo-reflector lamp output may be lower than that indicated by an exposure meter, so it is advisable to compensate for this by increasing exposure time or the lens opening. Whenever possible, test exposures are recommended.

• Other factors requiring consideration when determining the exposure time, are lamp configuration, use duration and line voltage, as they may affect lamp output and color balance.

Fluorescent Lamps & High-Intensity Discharge Lamps

• For the best results, the following combinations of color compensating filters are recommended. However, for exacting work, test exposures are advisable.

<table>
<thead>
<tr>
<th>Lamp Type</th>
<th>Fluorescent</th>
<th>High-Intensity Discharge</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Daylight (D)</td>
<td>Cool White (C.W)</td>
</tr>
<tr>
<td>Color Compensating Filters*</td>
<td>10M + 10Y</td>
<td>—</td>
</tr>
<tr>
<td>Exposure Corrections**</td>
<td>+1/3</td>
<td>—</td>
</tr>
</tbody>
</table>

* Fuji Color Compensating Filters (or Wratten Color Compensating Filters)

** Exposure correction values include filter exposure factors. These values are added to unfiltered exposure meter readings. A "+" followed by a number indicates the required increase in lens opening.

• When the fluorescent lamp characteristics are unknown, to obtain generally acceptable results, use a 30M compensating filter and open the lens one stop (+1).

NOTE Different compensation may be required according to special lamp types and length of use, so test exposures are recommended, whenever possible.

• Shutter speeds of 1/125 second for high-intensity discharge lamps and 1/30 second or larger, for fluorescent lamps, will avoid AC power-induced changes in brightness and color being recorded on the film.

Tungsten Lamps

A Fuji Light Balancing Filter LBB-12 (or Wratten filter No.80A) is recommended along with a 2-stop increase in lens opening, when using 3200 K tungsten lighting. In the case of cameras with TTL metering, there is no need for additional exposure compensation.

5. LIGHTING EQUIPMENT

The condition of umbrellas, reflectors, diffusers and like devices, could influence photographic light quality. Periodically check lighting equipment for deterioration.

6. LONG EXPOSURE COMPENSATION

No exposure or color balance compensation is required for exposures within a 1/4000 to 2 second shutter speed range. However, for exposures of 4 seconds or longer, provide the compensations indicated below.

<table>
<thead>
<tr>
<th>Exposure Time (sec.)</th>
<th>1/4000 to 2</th>
<th>4</th>
<th>16</th>
<th>64</th>
</tr>
</thead>
<tbody>
<tr>
<td>Exposure Corrections*</td>
<td>Unnecessary</td>
<td>+ 2/3</td>
<td>+ 1 1/2</td>
<td>+ 2</td>
</tr>
</tbody>
</table>

* A "+" followed by a number indicates the required increase in lens opening.

Except for special effects, the normal intensity ratio for main-to-fill subject lighting should remain within 1:4 limits.
7. FILM HANDLING

- Expose film before the expiration date indicated on the film package and process as soon as possible after exposure.
- When loading and unloading roll film, avoid direct sunlight. If there is no shade, turning one’s back toward the sun will shade the film.
- Camera-loaded film should be exposed and processed immediately.
- Unprocessed film should be kept away from X-rays used to inspect checked-in baggage, etc. at airport terminals. Strong X-rays can cause fogging of unprocessed film. It is recommended such film be placed in your carry-on baggage whenever possible. (Consult with airport personnel for details.)
- Film fogging may occur near X-ray equipment used in hospitals, factories, laboratories and other locations. Always keep film away from possible sources of radiation.

8. FILM STORAGE

**Unprocessed Film**

- Storing exposed or unexposed film under hot and humid conditions may adversely affect speed, color balance and physical property changes. Store film under the following conditions.
  - Ordinary Storage: Protect from heat.
  - Long-term Storage: Below 0°C (32°F)
- Building materials, finishes used on newly manufactured furniture, paints and bonding agents may produce gases which affect photographic film. Do not store film, lightproof boxes of film, loaded cameras or film holders near these materials.
- Before use, allow films to stand at room-temperature over 1 hour. Opening the package/box while film is cold may cause harmful condensation.

**Processed Film**

Exposure to light, high temperature and humid conditions can cause color changes in processed films. Therefore, place such films in sleeves and store them in dark, dry, cool and well ventilated locations under the following conditions.

- General Storage: Below 25°C (77°F) at 30% to 60% RH
- Long-term Storage: Below 10°C (50°F) at 30% to 50% RH

**NOTE**

As with all color dyes, those used in this film will discolor or fade with time.

Same as those for the current SUPERIA 1600.

10. TECHNOLOGIES INCORPORATED IN SUPERIA 1600

10-1 Nano-structured Σ (Sigma) Grain Technology

- The new SUPERIA 1600 has incorporated the newly developed Nano-structured Σ (Sigma) grain, a further advance over the current emulsion technology, to achieve sharp, smooth image quality, regardless of the film’s ultrahigh speed.
- To achieve the high sensitivity and small volume of the Nano-structured Σ (Sigma) grain, uniform, thin-crystal technology was used to produce crystals that are approximately 60% thinner than the hexagonal crystals used in the current SUPERIA 1600 film. The higher uniformity in size and improved light-collection efficiency of these grains have made possible a film with higher sensitivity than that of the current SUPERIA 1600 and smooth grain quality, regardless of the film’s ultrahigh speed.

10-2 Super Efficient Coupler Technology

The use of new couplers has enhanced color development efficiency.

11. PROCESSING

This film is intended for processing by Fujifilm Processes CN-16, CN-16Q, CN-16FA, CN-16L, CN-16S or Process C-41.

11-1 Replenishment Rate

The following table shows the replenishment rates for each type of Fujifilm Processes.

<table>
<thead>
<tr>
<th>CN-16Q</th>

</tbody>
</table>

*Replenishment Rate ...... Replenisher volume (mL) per single roll (135/24 exp.)
4-2 Processing Solution Control
Use the current 135-size control strips for processing solution control.

4-3 Processing-Photographic Characteristics
Same as those for the current SUPERIA 1600.

12. PRINTER CONDITIONS
This film can be printed on the same printer setup with results similar to the current film. However, depending on the printer type, a slight blue cast might appear in the overexposed areas. If this occurs, adjustment of printer conditions may be necessary.

13. JUDGING EXPOSURE RESULTS
SUPERIA 1600 exposure results can be accurately predicted by using an electronic densitometer equipped with Status M filters. An 18% gray card, receiving the same illumination as the subject, when read through the RED filter should render density readings between 0.65 and 0.85 (for exposures under recommended lighting and with optimal film processing).

14. FILM STRUCTURE

15. DIFFUSE RMS GRANULARITY VALUE
Micro-densitometer Measurement Aperture: 48 µm in diameter
Magnification: 12 ×
Sample Density: 1.0 above minimum density

16. RESOLVING POWER
Chart Contrast 1.6 : 1 .................... 50 lines/mm
Chart Contrast 1000 : 1 ................... 125 lines/mm
17. CHARACTERISTIC CURVES

Exposure : Daylight, 1/125 sec.
Process : CN-16
Densitometry : Status M

18. SPECTRAL SENSITIVITY CURVES

Process Densitometry : CN-16
Density : Status M
Densitometry : Status M
Density : 1.0 above D-min.

19. MTF CURVE

Exposure : Daylight
Process : CN-16X

20. SPECTRAL DYE DENSITY CURVES

Typical densities for a mid-scale neutral subject and for D-mini

* Sensitivity equals the reciprocal of the exposure (J/cm²) required to produce a specified density.

NOTICE The data herein published were derived from materials taken from general production runs. However, as Fujifilm is constantly upgrading the quality of its products, changes in specifications may occur without prior notice.
